FROM CUSTOMER INTELLIGENCE TO SHOP GROWTH POTENTIAL

CONTEXT

- The sales network identifies **customer opportunities** based on financial health, engagement, and needs.
- Physical shops generate business through **direct sales and cross-sell**, including online conversions.
- As the sales network expands, **improving shop-level productivity** becomes essential for sustainable growth.

CHALLENGES

- Similar sales may hide **different growth potentia**l.
- Growth is **limited** by demand, execution, staffing, and risk.

OBJECTIVES

- **Estimate attainable growth** and identify opportunity gaps.
- **Prioritize resources** and actionable interventions.

IMPROVING DATA RELIABILITY

DATA CHALLENGES

78% of TW applications & 94% of leads
sit outside listed shops

79% of signed CC/BNPL contracts
have zero credit amount.

36% of leads
have invalid/system employee IDs.

20% of signed contracts
fall in months with skewed overdue data

CLEANING RESULTS

5,915
rows removed

54 → 34
provinces

CORRECTIVE ACTIONS

- Restrict analysis to identifiable shops and disclose coverage limitations.
- Use billing amounts or contract counts for CC/BNPL.
- Restrict overdue analysis to Mar 2025–Jul 2026.

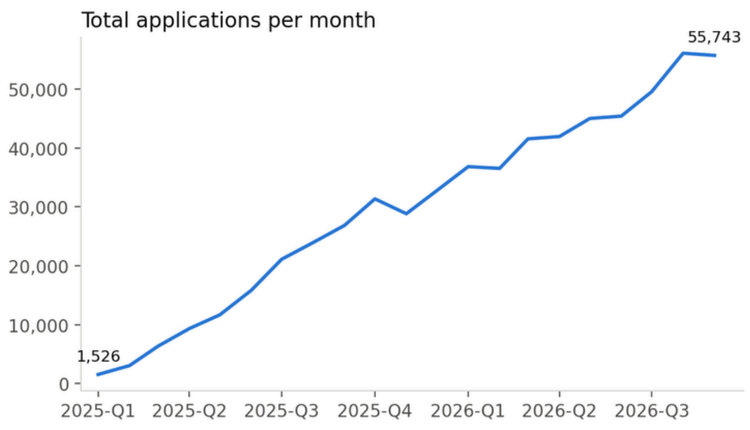

MEASURING GROWTH POTENTIAL,
GUIDING RESOURCE ALLOCATION

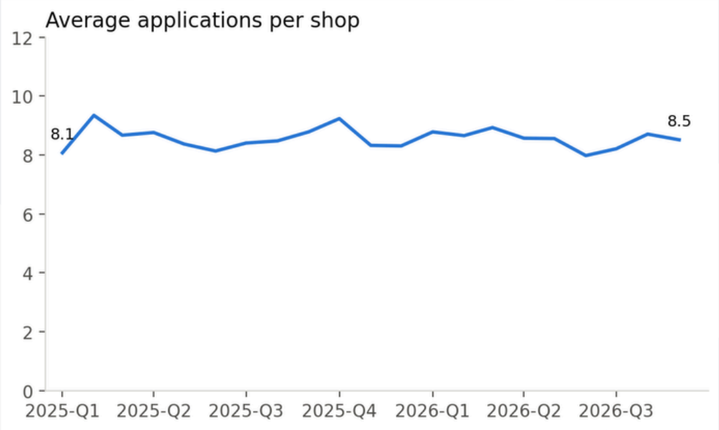

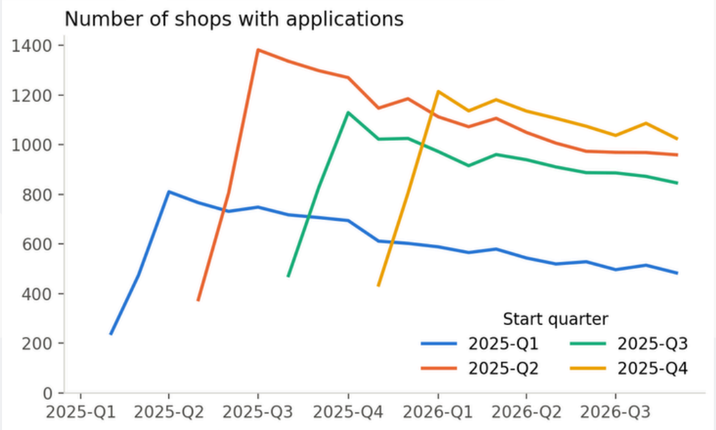

KEY DECISION How should Sales Management allocate resources to maximize shop growth?

NETWORK GROWTH ≠ SHOP PRODUCTIVITY

The network grew 36× in applications, but each shop did not get more productive

1,526 → 55,743
applications per month

8.1 → 8.5
applications per shop per month

40% stopped selling
2025-Q1 cohort · within 1 year

Growth came from opening shops, not from making shops sell more

SAME SHOP TODAY, DIFFERENT POTENTIAL

Both: CD · Non-Aldi · Đắk Lắk · 4.33 contracts a month today

Shop A · Small

4.33 4.92 4.92 6.19

rising on its own, already at peer

Gap 0 → Hold

Shop B · Medium

4.33 3.60 6.52 8.20

falling if left alone, peers do far better

Gap +2.93 a month → Coach SAs

Current Actual
where it is

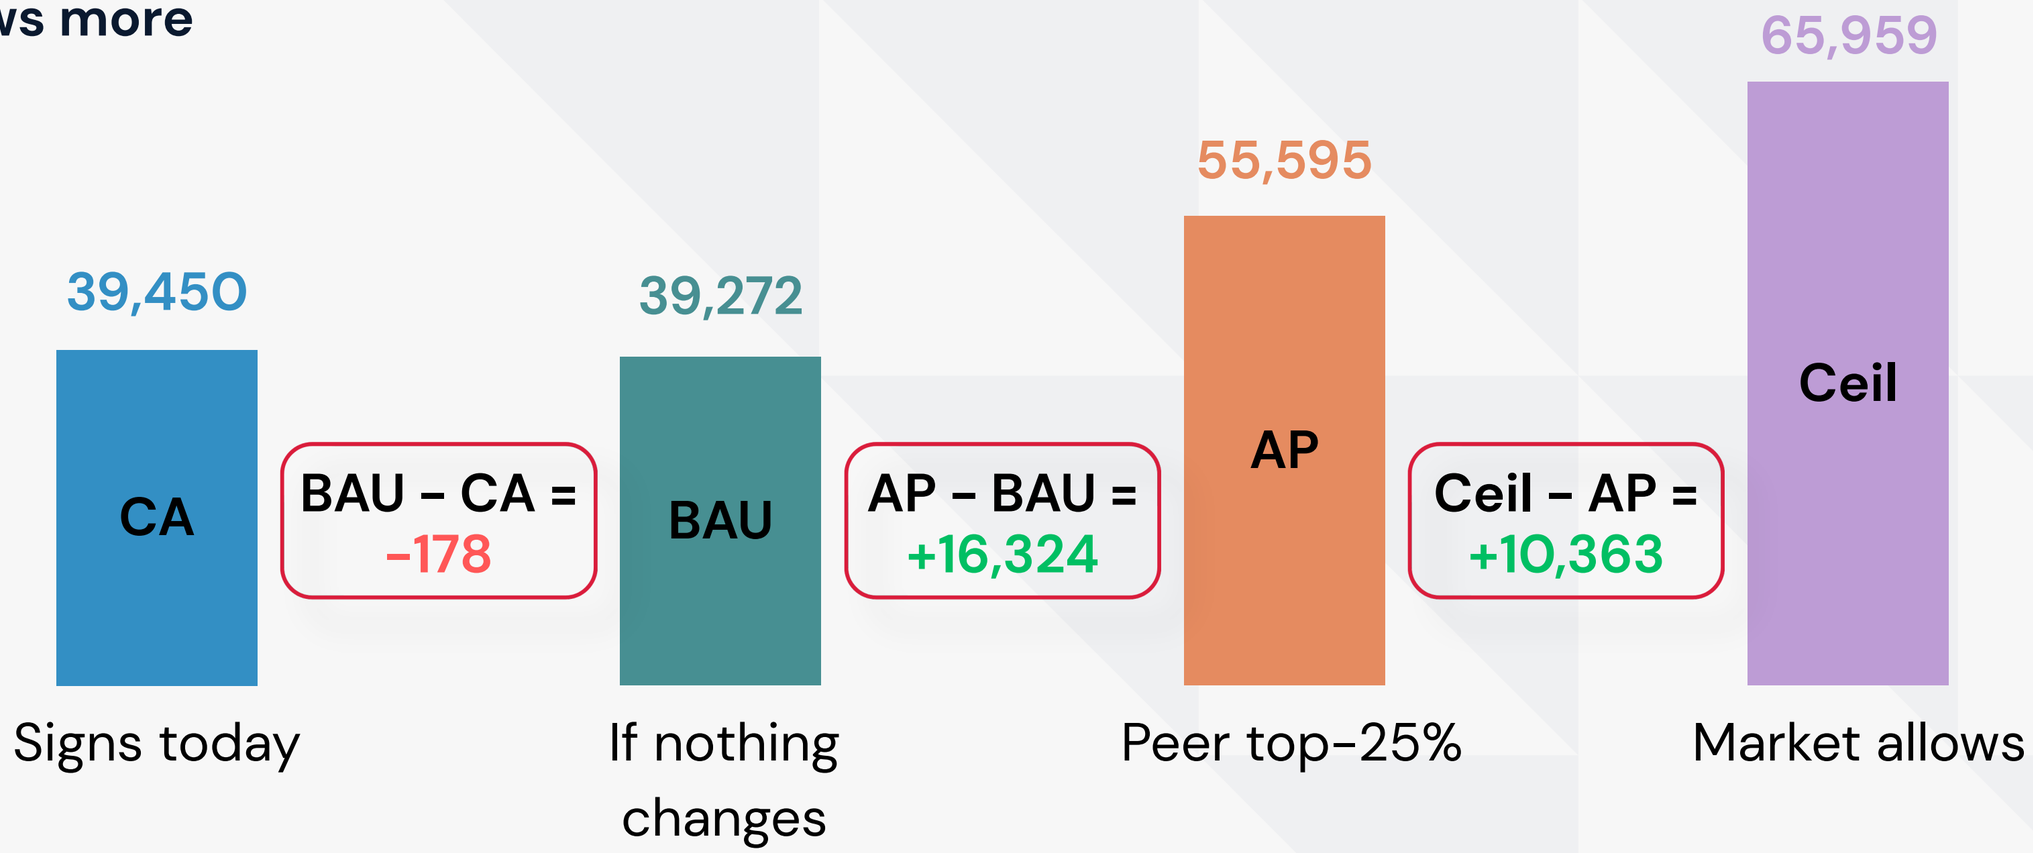

Business-as-Usual
where it drifts

Attainable Potential
what peers prove possible

Addressable Market Ceiling
what the market allows

FOUR NUMBERS FOR THE WHOLE NETWORK

Across 11,752 shops: flat if left alone, 42% more at peer level, and the market still allows more

The gap between BAU and AP is what management can act on.

WHAT DRIVES A SHOP'S SALES TODAY?

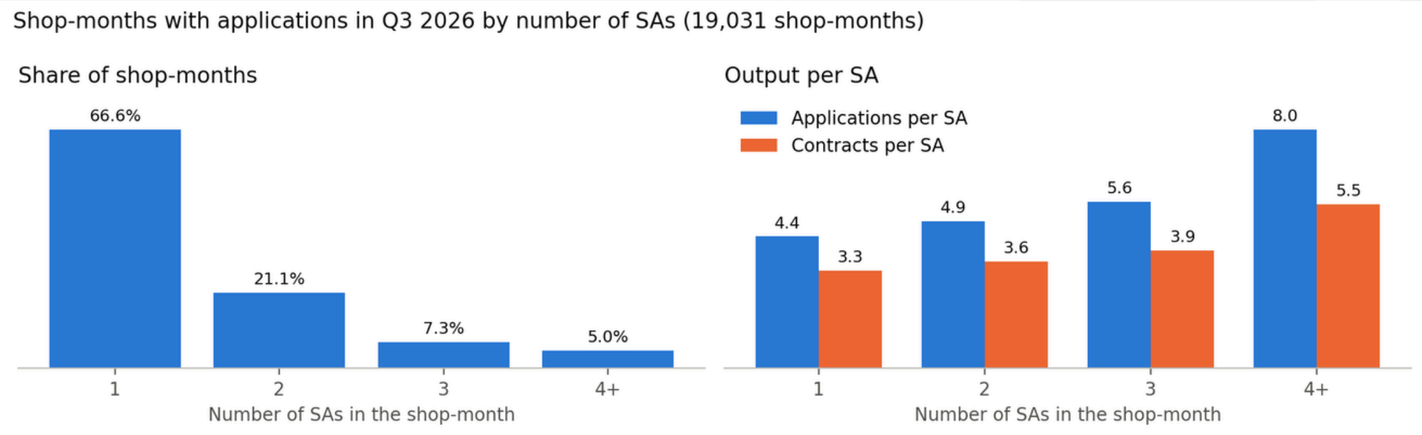

A shop's sales today depend on three levers: how many SAs, how many applications each, and how many get signed

39,450 contracts a month today · 3.4 per shop

66.6% of shop-months had only one SA in Q3 2026

4.4 vs 8.0 applications per SA (1 SA vs 4+ SA)

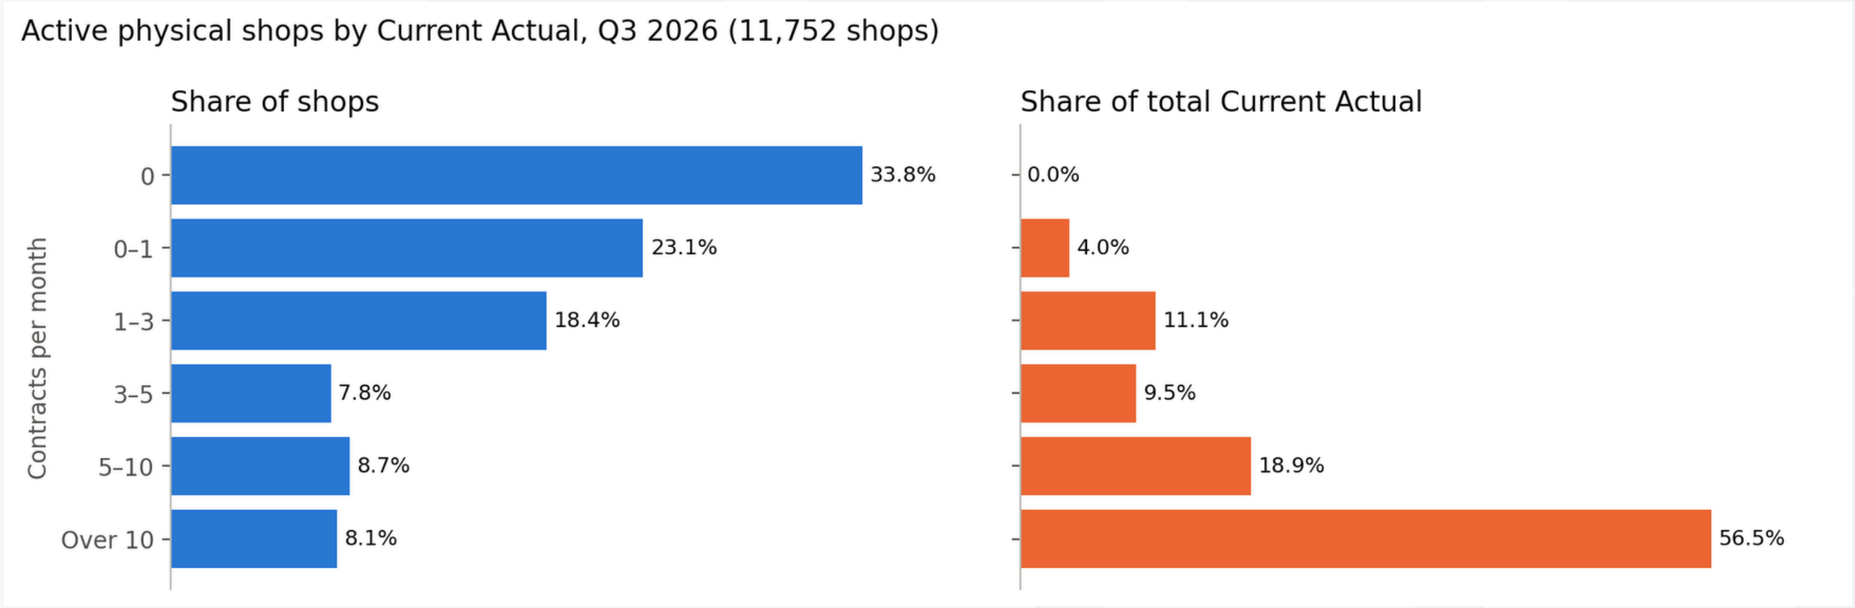

~72% of applications are signed

Definition. *Current Actual = average contracts signed per month, Jul–Sep 2026.*

WHAT CURRENT ACTUAL SHOWS

A third of shops sign nothing, 8% of shops sign over half, and most run on a single SA

33.8% of active shops (3,975) signed no contract in Q3 2026

56.5% of Current Actual produced by 954 shops (8.1%)

If nothing changes, today's network stops growing

×71 contracts | ×80 shops | −11% per shop Jan-2025 → Sep-2026. BAU for the next 6 months: +0.2% vs today

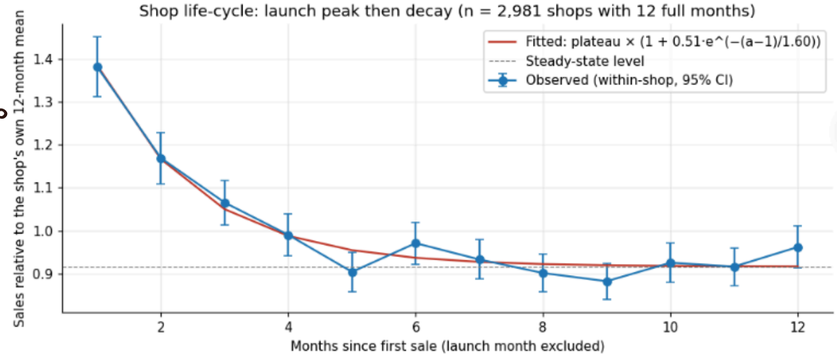

Growth is wider, not deeper

shops ×80 vs contracts ×71
each shop sells 11% less

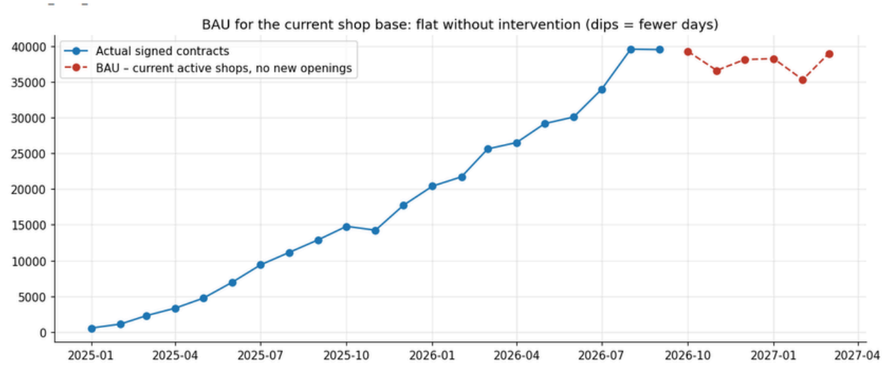

what happens to a shop after it open?

Today's newest shops are about to slow

Launch peak 1.38×
steady level from month ~ 5

BAU is flat — any growth must come from action or new shops

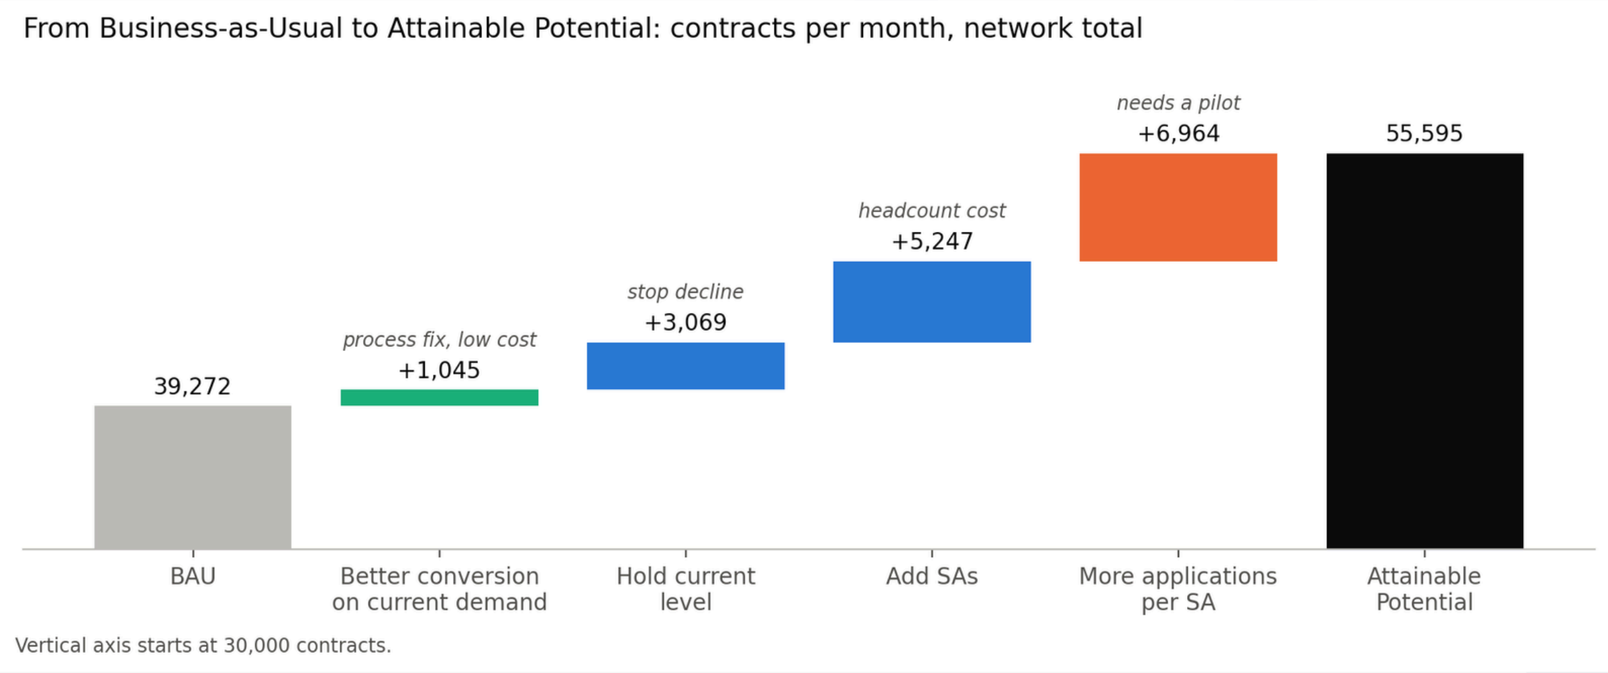

- **BAU:** Without action the network stalls — BAU is 37.7k contracts/month, +0.2% vs today, because growth so far came from openings.
- **CONCLUSION**: The current network **has no built-in growth** Openings explain 103% of past growth and new shops fade from +51% to steady within ~5 months, so BAU sits only +0.2% above today.

Business-as-Usual (BAU) = expected sales per month, Oct-2026 → Mar-2027, if staffing, process and leads stay as today.

ATTAINABLE POTENTIAL

Matching the top 25% of similar shops adds 16,324 contracts a month, three quarters of it from more SAs and more applications per SA

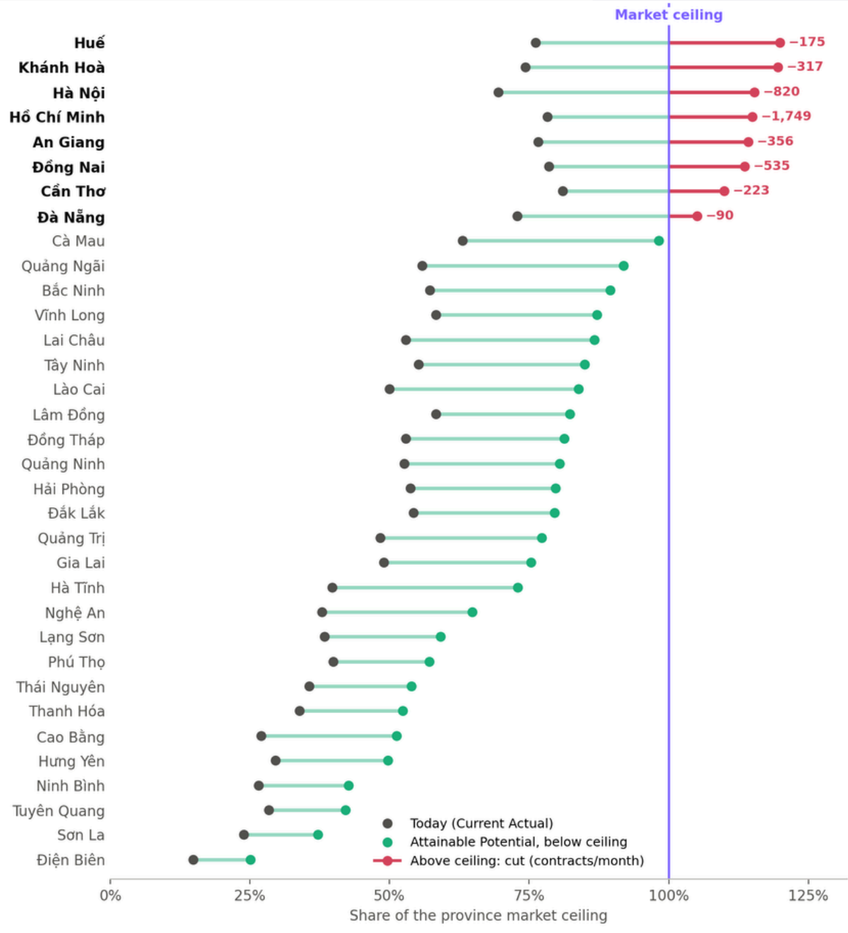

AP = what a shop signs if it matches the top 25% of shops like it (same size, industry, model, province)

The gap is an execution problem: people and their productivity.

WHERE THE CEILING BINDS

The market caps growth in only 8 of 34 provinces; elsewhere the limit is people, not demand

65,959 contracts a month

−4,266 cut from AP (20.7%)

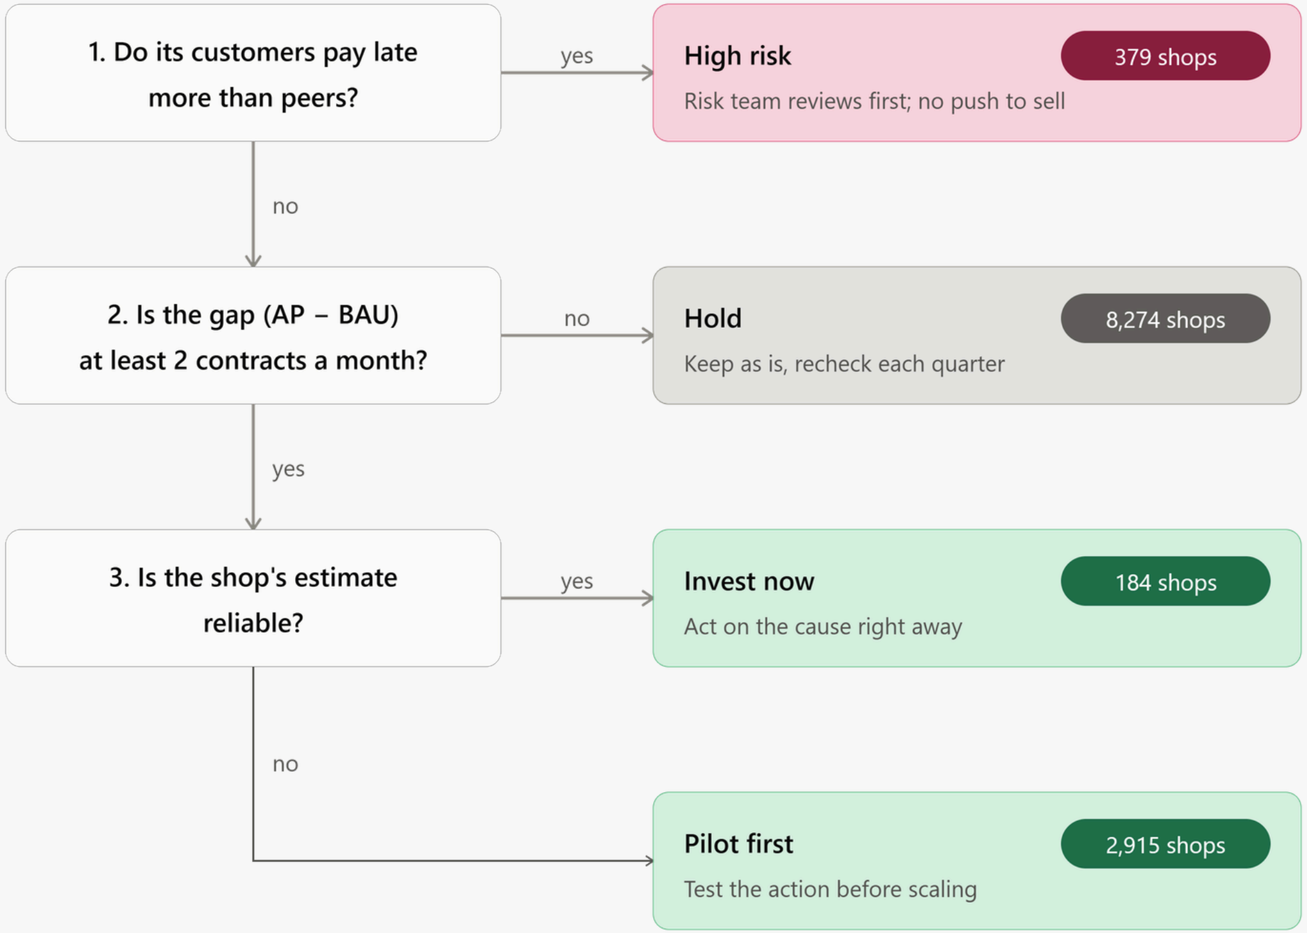

73% of the cut in HCMC, Dong Nai (most shops)

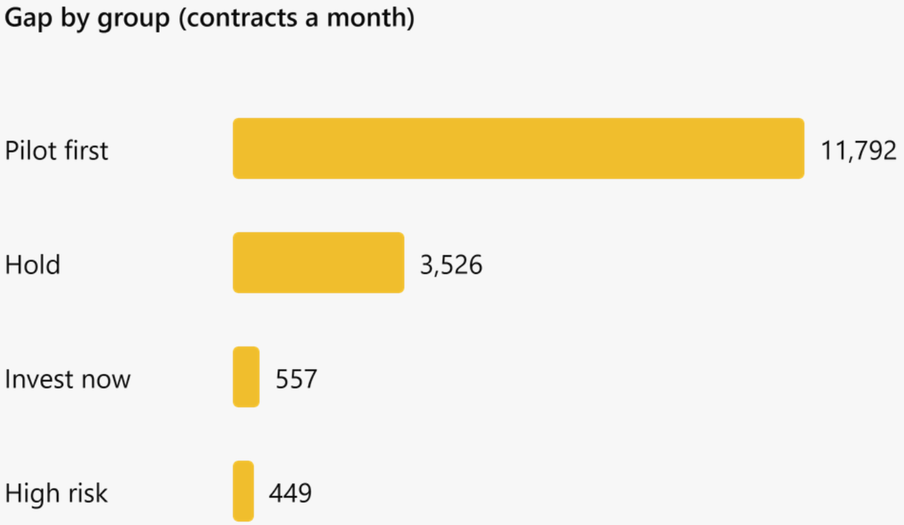

Hiring and coaching, not new demand, is the constraint in most provinces.

Definition. Ceiling = what a province could sign if it sold like the best quarter of provinces, per working-age person

ONE DECISION PER SHOP

Read together, the four numbers give each shop one decision: invest, pilot, hold, or fix risk first

75.6%

of the gap sits in 3,099 Invest-now and Pilot shops

Only 22% of Invest-now and 49% of Pilot shops
stay in the same group next quarter → recompute every quarter

WHY EACH SHOP HAS A GAP

Three quarters of the gap traces to SA productivity or too few SAs, and each cause has its own fix

MAIN CAUSE OF GAP	SHOPS	SHARE OF THE GAP	ACTIONS
SA productivity	2,663		coach SAs
Staffing	1,469		add SAs (pilot first)
Shop decline	1,502		ASM visit
Near ceiling	646		hold
Risk	270		risk review
Cross-sell, cancellation, rejection	39/14		CC/CL training, call back, reduce rejection

The cause decides the action → next slide ranks the actions.

WHICH ACTIONS FIRST

Coaching SAs is the biggest and cheapest lever

adding SAs is big but needs proof first

high impact

low impact

harder / costly

easy / low cost

4,333

Add SAs

needs 2,374 SAs

→ pilot first

5,618

Coach SAs

76.8 bn VND

2,688 shops

→ do now

1,822 ASM visit

45 Reduce rejection

Supporting actions

CC/CL training 391

Call back 139

ROADMAP

Do the cheap actions now, test adding SAs for three months, then scale what works

Gate: pilot result

11/2026 – 01/2027

DO NOW + PILOT

ACTIONS

- **Coach SAs** in 2,688 shops
- Call back approved-not-signed clients; CC/CL training
- ASM visits **64** shops in decline
- Pilot **48 + 48** shops (act vs control)
- Risk team reviews **379** high-risk shops
- 45 extra SAs for Invest-now shops wait for the pilot

OWNER

Sales & ASMs · Training · Risk team

KPI: applications per SA, sign rate

02 – 04/2027

DECIDE

ACTIONS

- Read the pilot: act vs control
- **Scale** only if gain > 0 with 95% confidence and late rate does not rise
- Add SAs where it worked, starting with **184** Invest-now shops
- If not met: keep only the cheap actions

OWNER

Sales management · HR · BI

KPI: contracts per added SA (plan: 1.83), late rate vs control

05 – 07/2027

SCALE

ACTIONS

- Roll out to the **2,915** Pilot-group shops
- Recompute the four numbers every quarter
- Review the **3,638** shops with no applications: keep or close

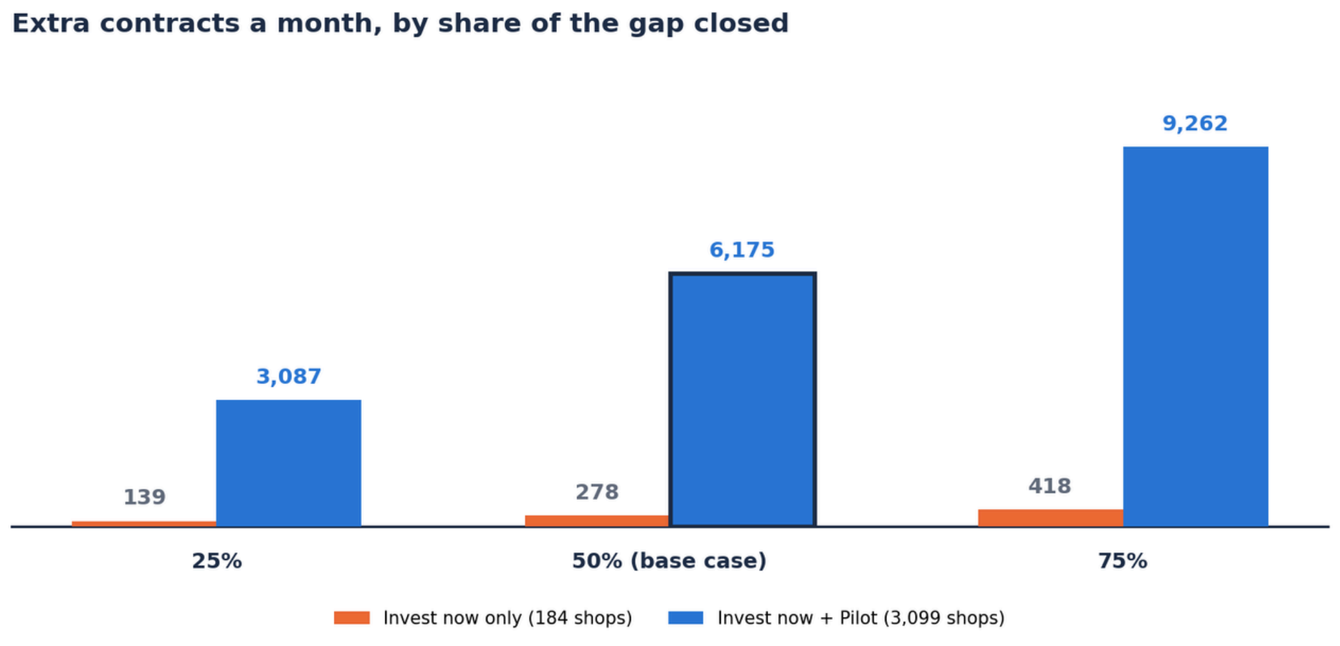

OWNER

Sales · BI · Network team

KPI: contracts vs BAU per group, late rate

Target at the end of the roadmap: +6,175 contracts a month (half the gap in priority shops)

CLOSING HALF THE GAP IN PRIORITY SHOPS ADDS ABOUT 6,200 CONTRACTS AND 85.5 BN VND A MONTH

+6,175 contracts a month at 50% of the gap

+15.7% vs BAU

+85.5B VND lent a month

Note. *network gap ranges 11.9k–20.6k under other assumptions*

PAST DATA SUPPORTS ADDING SAS; A 3-MONTH PILOT ON 96 SHOPS CONFIRMS IT BEFORE SCALING

1 WHAT PAST DATA SHOW

+3.35 contracts a month when a shop went from 1 to about 2 SAs

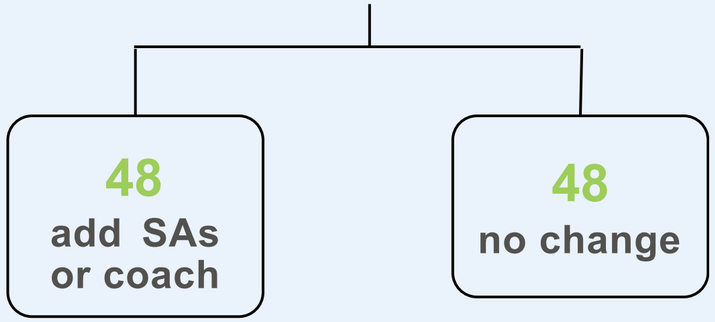

≈ **2.15** per added SA, above the 1.83 our plan assumes

Not proof yet: busy shops may simply hire more SAs

2 HOW WE TEST IT

96

Pilot shops, picked at random

3 months · Nov 2026 – Jan 2027
compare the change, act vs control

3 WHEN WE SCALE

- Gain is above 0 with 95% confidence
- Late rate does not rise

Both met → add SAs across the Pilot group

Not met → keep only the cheap actions (SA coaching, call back)

→ **+16,324 contracts a month are within reach — start with SA coaching, prove SA hiring with the pilot.**

THANK YOU

BUSINESS INTELLIGENCE
SEASON 10

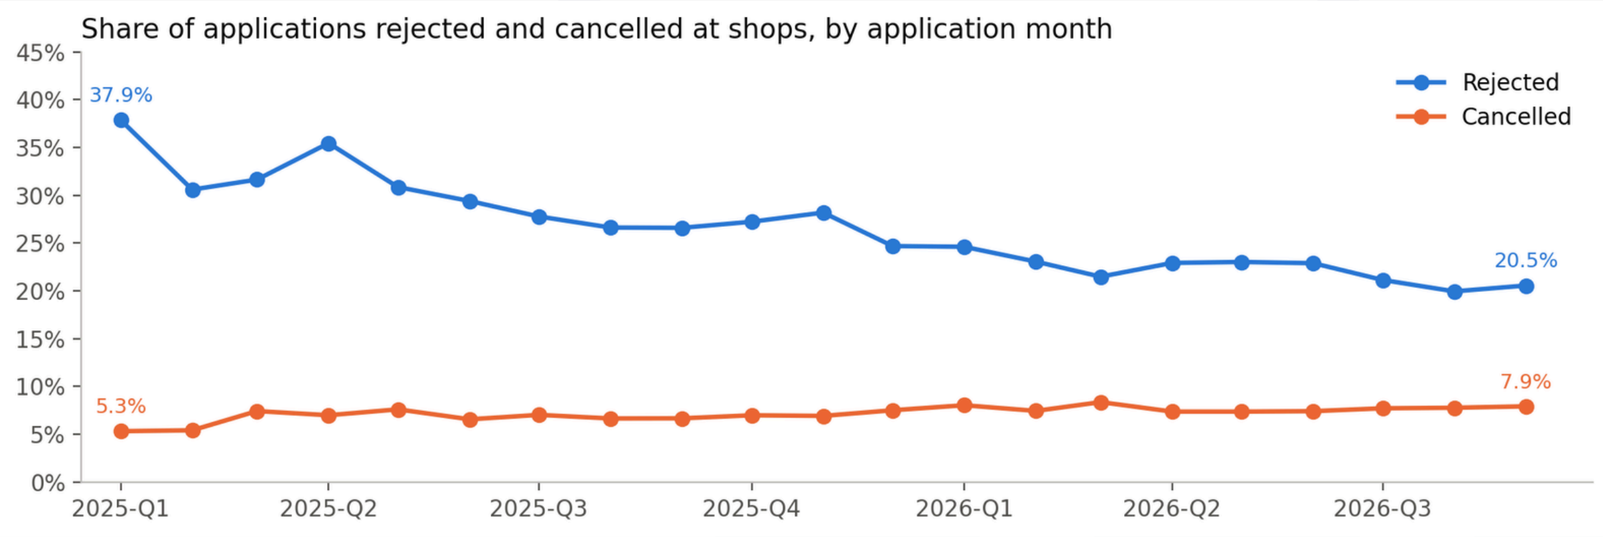

FINAL ROUND

PARALLAX

APPENDIX

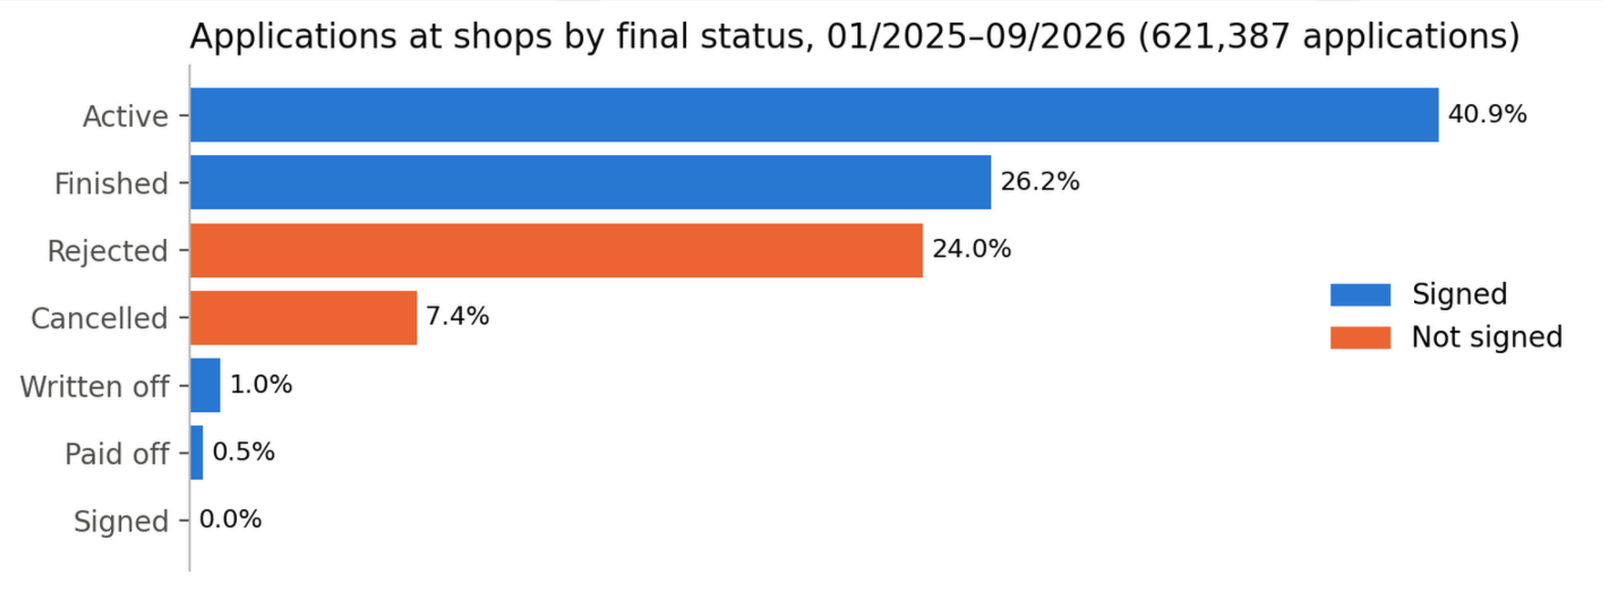

KDL Ú vjp pro 123

REJECTION & CANCELLATION TRENDS

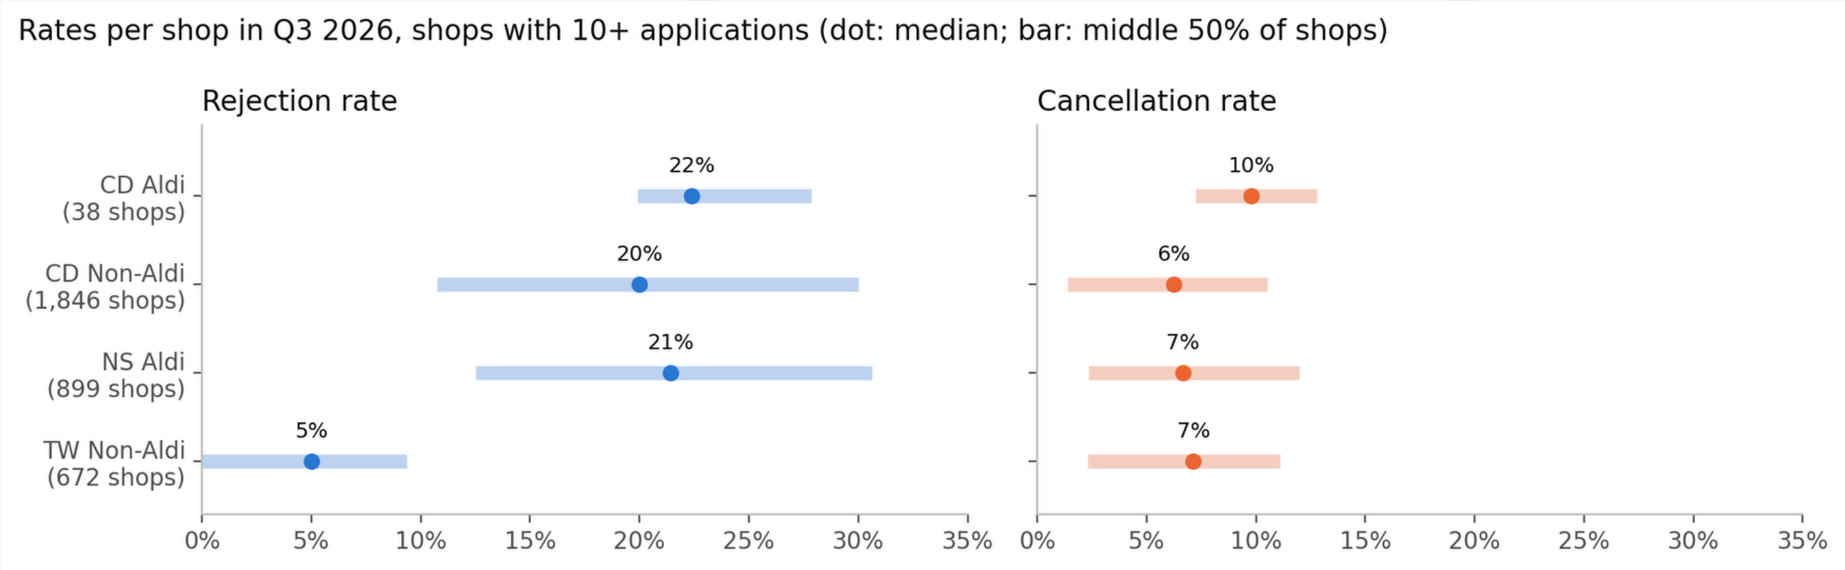

- Rejection rates **declined from 37.9% to 20.5%** over the observation period.
- Cancellation rates **increased slightly from 5.3% to 7.9%**, partially offsetting the improvement in rejection rates.

APPLICATION STATUS DISTRIBUTION

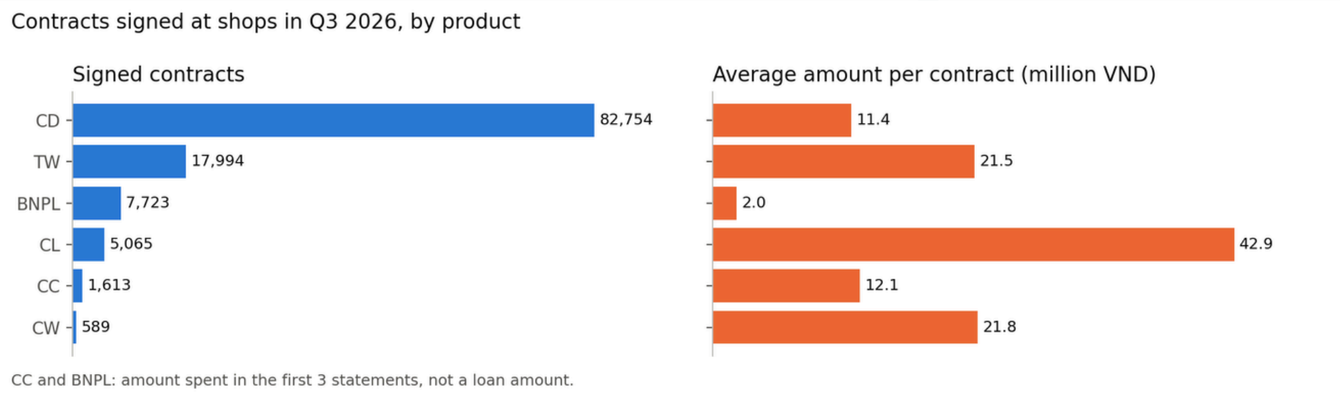

- **40.9%** of applications were classified as Active, while **26.2%** were Finished.
- Rejected and cancelled applications represented **31.4%** of all applications.

REJECTION & CANCELLATION BY SHOP SEGMENT

- Median rejection rates were around **20–22%** across CD and NS shops, compared with **5%** for TW Non-Aldi.
- **CD Aldi** had the highest median cancellation rate (10%), versus 6–7% in other shop groups.

CONTRACT PERFORMANCE & PRODUCT MIX

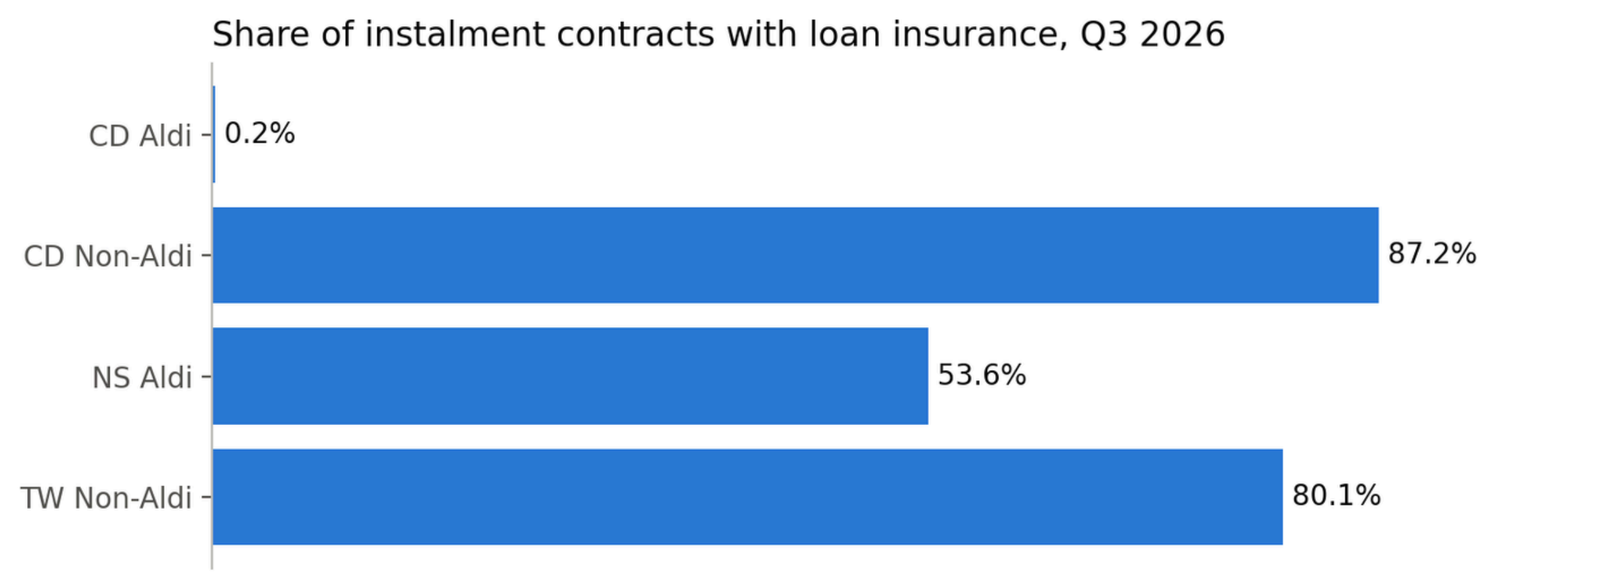

- **CD generated the highest signed contract volume (82,754)**, while CL recorded the highest average amount (VND 42.9M per contract).

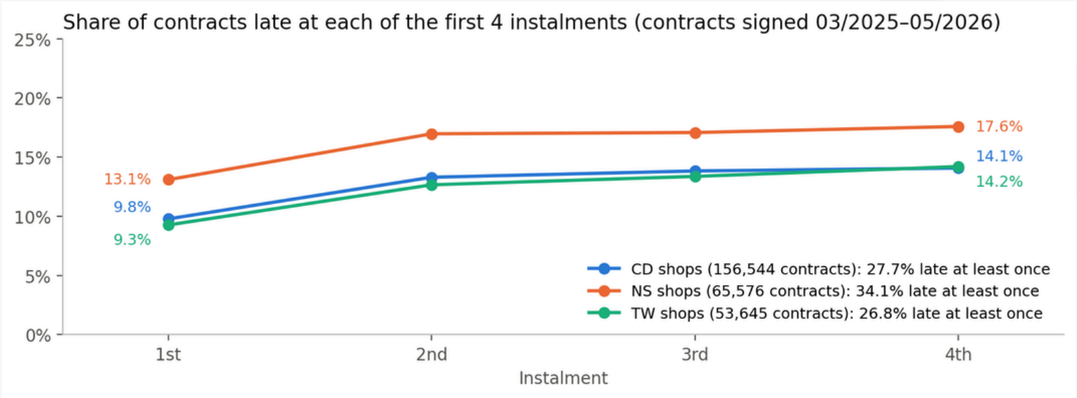

- Product composition differed across segments: **Mobile dominated CD (55%)**, while **Two-Wheelers accounted for 65% of TW contracts.**

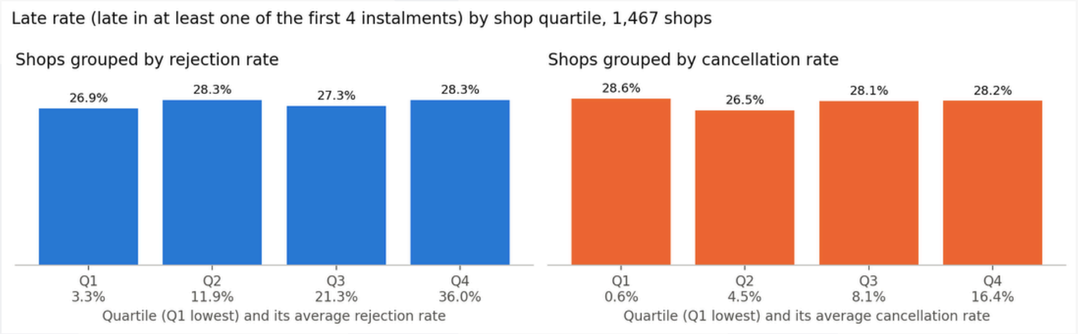

LOAN INSURANCE PENETRATION BY SEGMENT

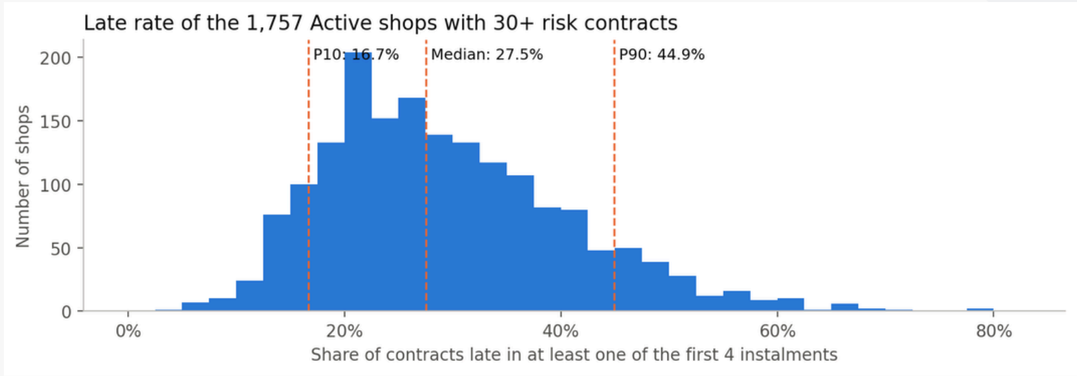

- Insurance penetration ranged from **0.2% in CD Aldi** to **87.2% in CD Non-Aldi.**
- NS Aldi and TW Non-Aldi recorded penetration rates of **53.6%** and **80.1%**, respectively.

REPAYMENT RISK & SHOP-LEVEL VARIATION

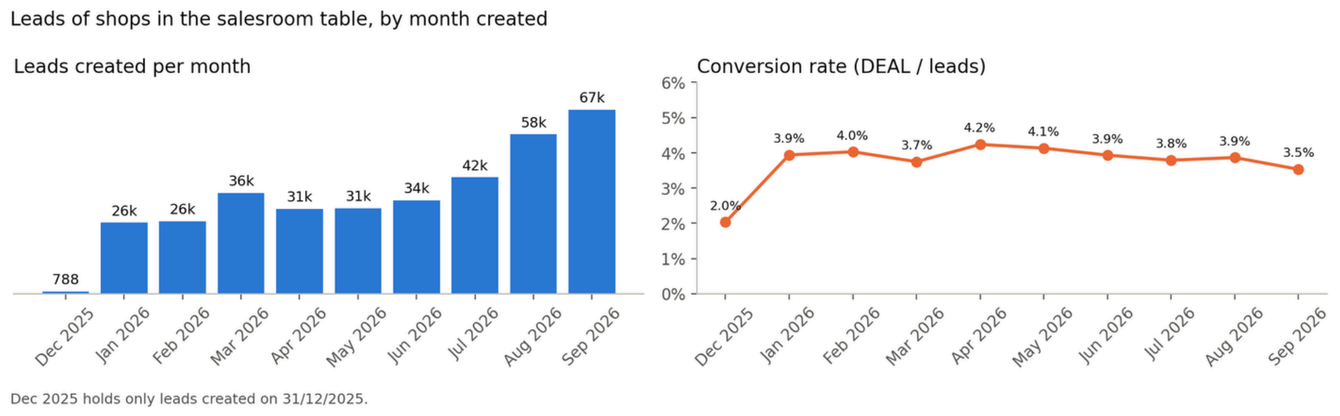

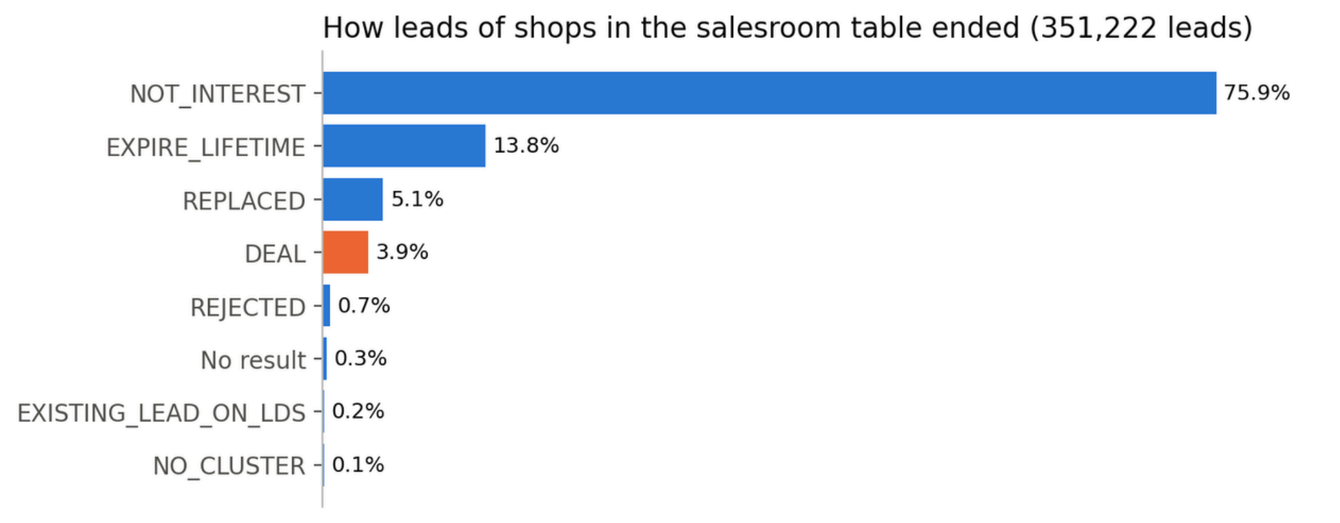

- The median shop-level late-payment rate was 27.5%, reaching **44.9%** at the 90th percentile.
- Late-payment rates varied only modestly across rejection and cancellation quartiles, suggesting limited descriptive association.

LEAD VOLUME & OUTCOME DISTRIBUTION

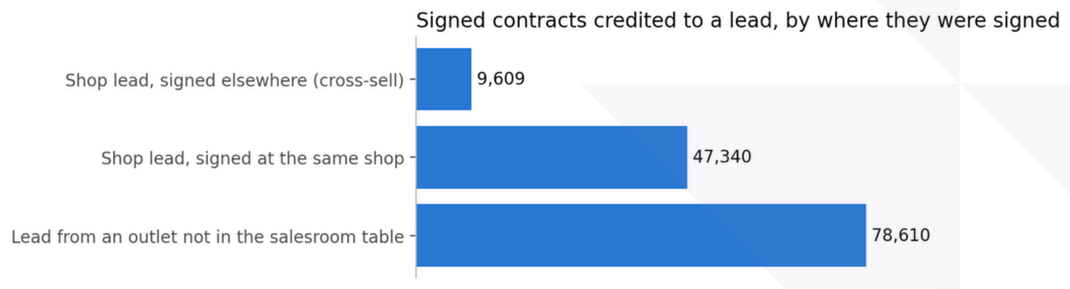

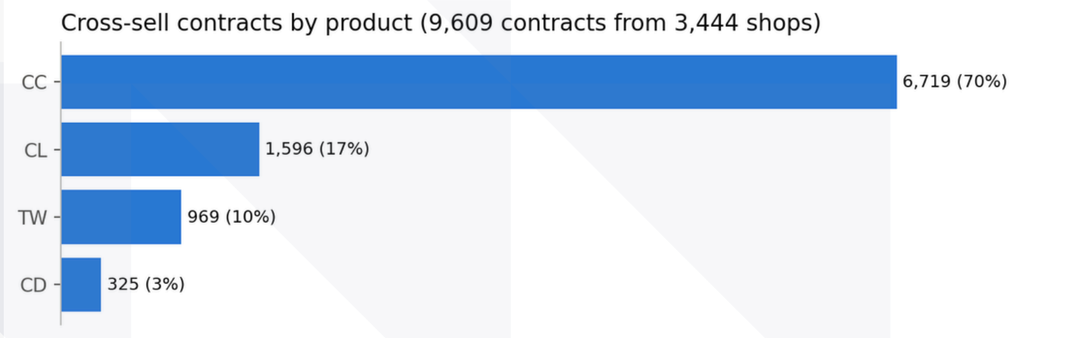

- Monthly lead volume increased to approximately 67K in August 2026, while the **DEAL rate remained around 3.5–4.2%** for most of 2026.

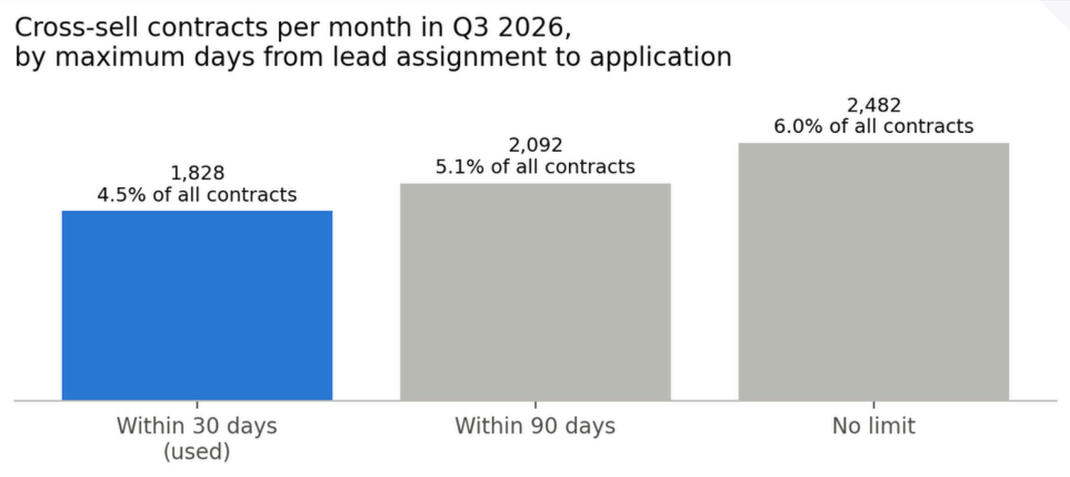

- 75.9% of leads ended as NOT_INTEREST, whereas **only 3.9%** were classified as DEAL.

CROSS-SELL ATTRIBUTION & PRODUCT MIX

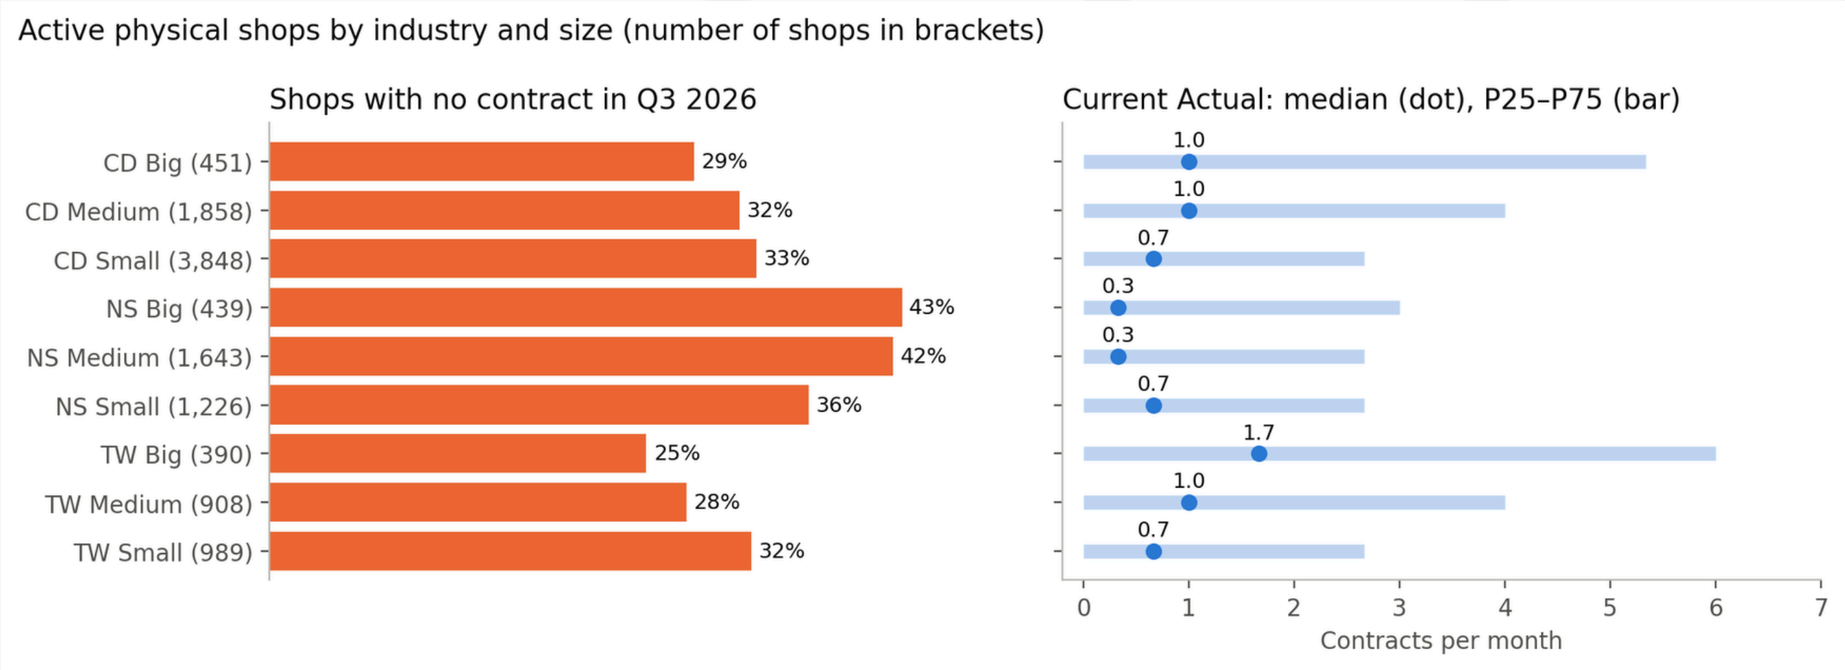

- **9,609 matched contracts** were attributed to listed-shop leads but signed elsewhere; 70% of these contracts were credit cards.
- In Q3/2026, the 30-day attribution window identified **1,828** cross-sell contracts, compared with **2,092** under the 90-day window.

HOW CURRENT ACTUAL IS CALCULATED

Current Actual = average per month, Jul–Sep 2026, of contracts signed at the shop + cross-sell contracts credited to the shop

Contracts at the shop = SAs × applications per SA × sign rate

Sign rate = 1 − rejection rate − cancellation rate

HOW BUSINESS-AS-USUAL IS CALCULATED

FORMULA

$$BAU = L \times e^{1g1(h - l)} \times f(age) \times (days / 30.44) \times e^{1b1s}$$

L	Base level: the shop's average daily sales over the last 6 months
g	The shop's recent 6-month trend, after filtering noise
k = 0.355	Share of that trend that lasts: about one third, stable over 10 starting points
h = ī	Months ahead, counted from the middle of the 6-month window
f(age)	Life-cycle curve: new shops sell more at opening, then settle
days, B·s	Month length and seasonality (seasonality is small: B = 0.17)

Forecast for each month, Oct 2026 – Mar 2027. Network total including cross-sell: **39,272** contracts a month.

WHY EACH PART IS NEEDED

+51% sales at opening vs the settled level; leaving the life-cycle curve out biases BAU by **+7%**

1⁄3 of a recent trend continues; extending the raw trend biases BAU by **+49%**

–0.15 correlation of monthly swings between 2025 and 2026: seasonality does not repeat, so it is kept small

BACK-TEST ON PAST MONTHS

0.460 error of BAU vs **0.474–0.475** for “average of the last 3 months”

Error by shop size: **0.801** for shops under 1 contract a month, **0.362** for shops with 10+ – small shops go to **Pilot**, not Invest now.

HOW ATTAINABLE POTENTIAL IS CALCULATED

METHOD IN 5 STEPS

Peer group
Shops of the same size, industry, filing model and province. Groups under 5 shops use the national benchmark.

Benchmark = top-25% level of the group
75th percentile for SA_2, applications per SA, cross-sell per lead (shops with 30+ leads); 25th percentile for rejection and cancellation rates (shops with 10+ applications).

Lift only weak KPIs
Each KPI below the benchmark is raised to it; contracts are recomputed with SA_2 × applications per SA × sign rate + cross-sell.

Guards
Rejection is cut only if the shop has 30+ risk contracts and late payers no higher than its group. Result never above the group's top-25% contracts, never below BAU.

Cap at the market ceiling
AP = the smaller of the result and the shop's ceiling.

RESULT, CONTRACTS A MONTH

59,861
before ceiling
+52% vs BAU

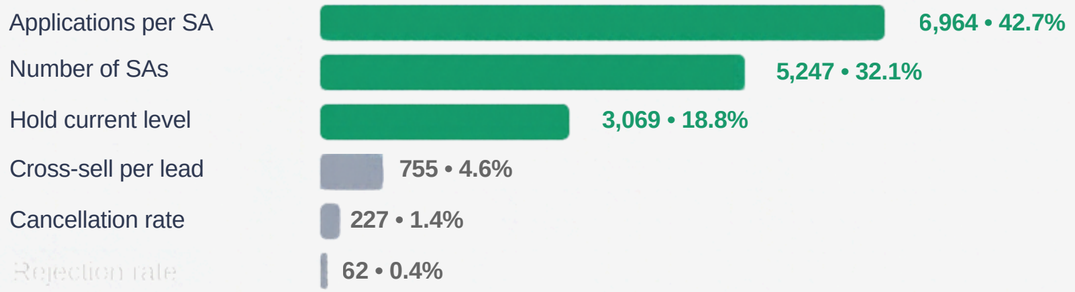

→

–4,266
cut by the
market ceiling

→

55,595
Attainable Potential
gap +16,324 vs BAU

WHERE THE 16,324 GAP COMES FROM, BY KPI

CHECK WITH A SECOND METHOD

4.1×

Raising only the sign rate and cross-sell, on 1,342 shops with enough data, gives +1,356 contracts a month, 4.1x the "better conversion" part of AP on the same shops – that part is a **cautious** estimate.

Source: Step 3 notebook (AP, section 3.10 for the second method), Step 5 notebook (ceiling, gap by KPI).

HOW THE MARKET CEILING IS CALCULATED

Flow.

1. Penetration › **2. Benchmark** › **3. Province ceiling** › **4. Split to shops**

contracts a year per 1,000 working-age

median of the top quarter of provinces

benchmark × working-age population

by each shop's own level;

Definition.

Penetration (province) = contracts a year per 1,000 working-age people (Q3 2026)
→ 65,959 summed over shops

π* = median penetration of the top quarter of provinces = 13.3

Province ceiling = max(**π***, own penetration) × working-age population → 61,083 a month (1.49× today)

Shop ceiling = province ceiling split by each shop's max(AP before cap, CA); at least max(CA, BAU)

Source. Vietnam's National Statistics Office (2025), Resolution No. 202/2025/QH15
